

P165: the 18+ PARAMETERS of the SM

Ref: "The 18 arbitrary parameters of the Standard model & your everyday life"
ROBERT CAHN, RMP 63 JULY 1996

STANDARD MODEL

5 FERMIONS: Q and L

1 HIGGS: $H \leftrightarrow h + \boxed{\text{Goldstone Bosons}}$

∇ COVARIANT DERIVATIVE (GEOMETRY & GAUGE SYM)

$$D_\mu = \partial_\mu + ig_s T^M g_\mu^M + ig W_\mu^A T^A + ig' B_\mu$$

$\uparrow \quad \uparrow \quad \uparrow$
3 GAUGE COUPLINGS

(3)

RENORMALIZATION (BRIEFLY): DIMENSIONLESS COUPLINGS
ARE ATTACHED TO RENORMALIZABLE INTERACTIONS

$\sim g^3 \log 1$ \leftarrow DIMENSIONS?

or

"1PI" vertex

one particle irreducible

$$\text{So: } g^{\text{OBS}} \sim g_0 + g_0^3 \log \Lambda$$

$$g_0 \sim g^{\text{OBS}} (1 - (g^{\text{OBS}})^2 \log \Lambda / \mu)$$

$$g_0 \sim g^{\text{OBS}}$$

SCALE @
WHICH
SUBTRACTION
IS EXACT

$$\Rightarrow g^{\text{OBS}} \sim g (1 + g^2 \log \frac{p^2}{\mu^2})$$

no Λ dependence,
but now depends on
ratio of kinematics
vs. scale μ

$\psi \rightarrow 2\psi$

INTERPRETATION : "COUPLING CONSTANTS ARE
NOT CONSTANT" (renormalization)

→ eg WHEN WE ARGUED THAT VACUUM
POLARIZATION CHANGES $V(r)$ CORRECTION
TO ELECTRON MASS

WHAT IS HAPPENING: THE "BEST" THEORY @ A DIFFERENT SCALE
HAS SLIGHTLY DIFFERENT PARAMETERS.

26
BUT: SAME PHYS IN QCD
MAY! (RENORMALIZ GROUP)
→ study of phase transitions

for SU(3): $g_s(\mu)$ gets larger as μ gets
smaller \rightarrow PERTURBATION THEORY BREAKS
DOWN

Strong force is "stronger"
Feynman diagram expansion
of FREE PARTICLES w/ few
interactions is not accurate

what we believe happens: confinement
 \hookrightarrow all color charges confine to color
neutral states @ low energy

MASS GAP: $\langle \bar{q}q \rangle \sim 100 \text{ MeV}$
or
CHIRAL CONDENSATE
(another view!)

confinement scale: $\Lambda \sim \text{GeV}$

characteristic hadron scale
comes from BINDING ENERGY

THE MASSIVE FERMIONS:

②

u c t
d s b
e μ τ

9 mass terms

eigenvalues of Yukawa matrices

Wb: CAN ~~REPLACE~~ REPLACE u_L, u_R TO MAKE EIGENVALUES m .

$$y L^+ H e_R \rightarrow L^+ (U^+ y U_{eR}) e_R + H$$

DIAGONALIZE y

USING FLAVOR (APPROX)

SYMMETRY: LET

y MATRICES DEFINE

"CORRECT" MASS EIGENSTATES

YUKAWA BECOMES MASS TERM
UPON $\langle H \rangle = v/2$ (HIGGS VEV)

②

$$V[H] \sim \sum (|H|^2 - v^2/2)^2$$

TWO PARAMS

2 - GIVES HIGGS MASS, VEV, SELF INTERACTIONS.

nb: we could not formally diagonalize
all Yukawas \rightarrow $SU(2)$ wants u_L & d_L
to be part of same Q doublet.

↳ but diagonalizing y_u & y_d
~~require~~ separate u_L & d_L
rotations.

if we do these rotations, we
pay the price in the $SU(2)$
kinetic term

$$\bar{u}_L \gamma^\mu W^- \underbrace{V_{CKM}}_{\uparrow} d_L + \text{h.c.}$$

CKM MATRIX: UNITARY MATRIX
ENCODING MISMATCH OF
 u_L & d_L ROTATIONS IN FLAVOR
SPACE (to diagonalize both
 y_u & y_d) : $V_{CKM} = U_{uL}^\dagger U_{dL}$

$$V^\dagger V = 1$$

V_{CKM} IS A 3×3 UNITARY MATRIX: 9 θ PARAM \rightarrow 9 PARAM
then REPHASE u_L & d_L (CORRESPONDING u_R , d_R
to keep MASSES REAL)

Remaining 4 params

$$V = \begin{pmatrix} V_{ud} & V_{us} & V_{ub} \\ V_{cd} & V_{cs} & V_{cb} \\ V_{td} & V_{ts} & V_{tb} \end{pmatrix}$$

each V_{ij} can be written
as a magnitude & phase: $V_{ij} = r_{ij} e^{i\theta_{ij}}$

if we ~~rephase~~ each of the down-type
quarks, we can remove the phases
in, say V_{ud}, V_{us}, V_{ub} . \rightarrow but

no more use
for rephasing

then we can use ~~rephasing~~
of d & t to remove 2 more phases

can remove 5 phases

④

\Rightarrow 9 params of $V_{CKM} \rightarrow$ 4 physical params

COMPARE \rightarrow IR matrix (orthogonal):

3 EULER ANGLES: the 4th physical
parameter is intrinsically complex

\downarrow
B decays

\hookrightarrow complex phase \leftrightarrow matter-antimatter asym
(gives a difference in
"h.c." terms)

PHYSICAL SIGNIFICANCE: to macroscopic nature
examples from Cahn article

- if $m_e \rightarrow m_\mu$, replace electrons w/ muons in atoms

then: muon capture destabilizes ~~complex~~ atoms

mass difference $m_\mu - m_\nu$
is larger than $m_n - m_p$

so instead of hydrogen \rightarrow neutrons
 \downarrow neutrons. no chemistry
 \rightarrow in GEN: AS WE INCREASE m_e , atomic matter shrinks

Bohr
radii
 \downarrow

- if $m_p > m_n$: PROTON DECAY.
 \hookrightarrow some light atoms stable (Hydrogen)

- masses of other particles affects
RG flow of couplings \rightarrow unification?

The missing PARAMETERS

in the SM (but not mentioned in the Gell article)

Dirac angle : θ phase / topological phase

↳ property of ~~CAUSALITY~~ ~~THEORY~~

RELATED to MATTER-ANTIMATTER ASYMMETRY

EXPERIMENTAL SIGNATURE: MAGNETIC MOMENT OF NEUTRON \rightarrow obs to be consistent w/ zero to high precision ... but no theoretical REASON!

↑
in contrast: fermion masses are small compared to Δ_{UV} because the $m \rightarrow 0$ limit enhances a symmetry.

ie for an angle, there is nothing special about $\theta = 0$.

POSSIBLE SOLUTION: AXION

Beyond the SM

- ν MASS \rightarrow ν YUKAWA
WEINBERG ϕ .

ANTICIPATE 4 PHASES + 3 MASSES
(in parallel w up/down quarks)

analog of QM matrix is PMNS matrix

SIGNIFICANCE: CP phase in ν sector
MAY EXPLAIN MATTER-ANTI-MATTER ASYM
[LEPTOGENESIS] \Rightarrow IN GENERAL, [BARYOGENESIS]
IS AN OPEN QUESTION

• GRAND UNIFICATION

COUPLING STRENGTHS SEEM TO CONVERGE @ HT SCALE

... POSSIBLE SIGNATURE OF $SU(5) \rightarrow SU(3) \times SU(2) \times U(1)$
SYMMETRY BREAKING? (only one GAUGE SYM)

DARK MATTER

ASTRO & COSM : most of matter in
universe is not "ordinary" SM
stuff

→ what is it?

QUANTUM GRAVITY / FORMAL QFT

@ M_{Pl} , we expect QFT of gravity
to be relevant. BUT: gravity is non-renorm.
→ quantum theory is plagued w/
apparent infinities — no "UV" scale
to point to.

Gravity is a very different beast

→ reason to suspect that QFT-as-we-know-it
may break down

Best option so far: string theory

but main output has not been QG but
lots of exciting formal results in QFT
e.g. AdS/CFT
